About Me

Namrata Bandekar

iOS Engineer at OANDA

Technical writer on raywenderlich.com

@namrataCodes

Agenda

- What is Machine Learning?
- Brief History
- ML Applications
- Getting started with ML in mobile apps

What is Machine Learning?

- Subfield of Artificial Intelligence
- Study of algorithms
- Learn from examples and experience
- No hardcoded rules

Supervised Learning

Source: Machine Learning Recipes <https://www.youtube.com/watch?v=cKxRvEZd3Mw>

(Very) Brief History

- **1952** : First game-playing program for checkers
- **1957** : Perceptron, the first Neural Network
- **1964** : ELIZA, an NLP program simulated a psychotherapist
- **1990s** : Data-driven approaches

Machine Learning in Today's World

Amazon Echo

Google Home

Self-Driving Cars

Machine Learning in Mobile Apps

Google Translate

Getting Started for mobile development

Google Mobile Vision

- Detect Faces
- Scan Barcodes
- Text Recognition (Android only)
- On-device processing

Face Detection

- Face Detection not recognition
- Detects multiple faces
- Detects faces with different orientations

Face Detection

- Detects landmarks like position of eyes, nose base, mouth, cheeks and ears
- Detects eyes open, closed, smiling
- Face tracking in live video

iOS Example

Import the framework

```
@import GoogleMobileVision;
```

Create a face detector

```
NSDictionary *options = @{
    GMVDetectorFaceLandmarkType : @(GMVDetectorFaceLandmarkAll),
    GMVDetectorFaceClassificationType : @(GMVDetectorFaceClassificationAll),
    GMVDetectorFaceTrackingEnabled : @(NO),
    GMVDetectorFaceMinSize: @(0.3),
    GMVDetectorFaceMode : @(GMVDetectorFaceFastMode)
};
self.faceDetector = [GMVDetector detectorOfType:GMVDetectorTypeFace options:options];
```

Find faces

```
NSArray<GMVFaceFeature *> *faces = [self.faceDetector featuresInImage:self.faceImageView.image
                                options:nil];
```

smiling 0.99

GMVDetectorFaceFastMode

GMVDetectorFaceAccurateMode

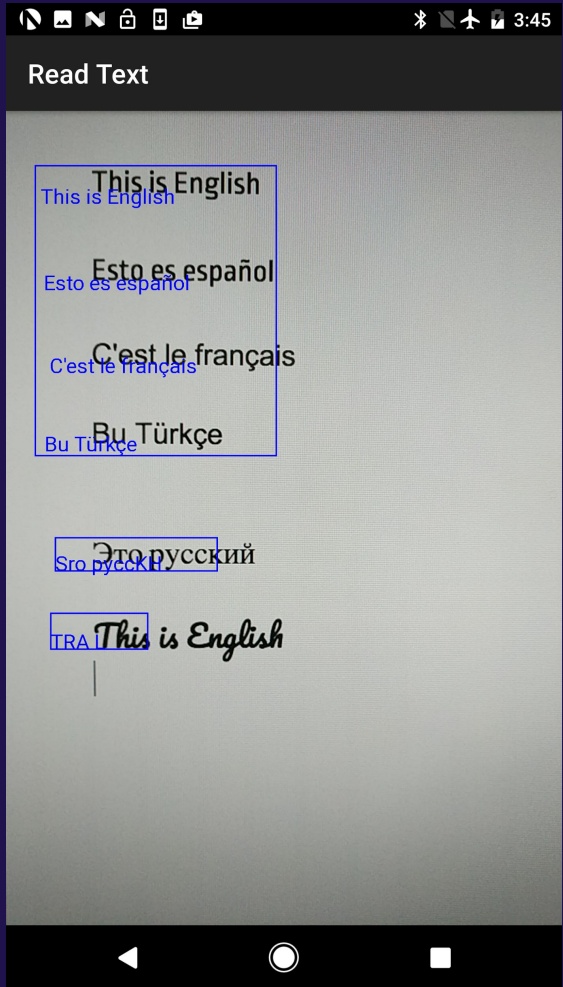

Face Tracking Demo

Limitations

- Face tracking not recognition
- Face is obstructed or disappears
- Face is too small or close to edge

Text Recognition API

- Latin based languages
- Recognizes text in images and live videos
- Text to speech
- Android only

Where To Go From Here?

TensorFlow

- Open Source
- Needs knowledge of machine learning
- Build and train your own models
- Build static libraries for on-device use

TensorFlow Demo

Thank You!

Questions?

<https://github.com/namrata-b/ios-vision>

<https://github.com/namrata-b/talks>

Face Detector Performance

- Speed vs. accuracy
- Use lower resolution images
- Configure min face size
- Fast vs. accurate mode

Text Recognizer Performance

- Higher accuracy than Tesseract
- *Cursive* vs. sans fonts
- Hard to recognize handwriting
- Special characters
- Limited languages - Google Cloud Vision API
- Text has to be vertical
